4081 & 4082 Process Controller Quick Start Manual PK531 (0037-75563) Page 1 of 6

The following symbols are use on the product labels:

$\underline{\wedge}$	Caution: Potential danger to life or limb. Refer to installation manual when connecting		Equipment protected through- out by double insulation
\sim	Alternating current	\geq	Both direct and alternating current

1. INSTALLATION

Installation should be only performed by technically competent personnel. It is the responsibility of the installing engineer to ensure that the configu-ration is safe. Local regulations regarding electrical installation & safety must be observed - e.g. US National Electrical Code (NEC) and/or Cana dian Electrical Code. Impairment of protection will occur if the product is used in a manner not specified by the manufacturer.

Installing Plug-in Modules

To access the plug-in modules, first remove the instrument from the housing.

- a. Pull front out to engage Front Latch. This prevents removal without a tool.
- b. Press latch with screwdriver through top vent hole. Remove front from case.
- c. Detach main boards by lifting first the upper, and lower mounting struts.
- d. Plug required modules into the correct connectors, as shown below. e. Locate the module tongues in corresponding slot(s) on the opposite board.
- Hold the Power and Input boards together while relocating on their mountings.
- g. Push the boards forward to ensure correct connection to the Display board.
- h. Replace the instrument by aligning the boards with the guides in the housing, and then slowly push the instrument back into position.

Re-fitting the Main Boards

This product is designed to allow the user to reconfigure some hardware options in the field by changing the modules fitted in slots 1, 2, 3, & A. The main boards (display/CPU, power supply, inputs 1 & 2 and digital input/USB) are factory fitted, but may be removed while reconfiguring the plug-in modules. Take care when re-fitting these boards. Observe the power supply board transformer color, and case labelling to check the supply voltage, otherwise irreparable damage may occur.

Panel Mounting

1. Insert instrument into the panel cut-out. 2. Hold front bezel perimeter only firmly and re-fit mounting clamp. Push the clamp forward, using a tool if necessary, until gasket compresses and instrument is held firmly in position.

NOTE: For an effective IP66 seal against dust and moisture, ensure gasket is well compressed against the panel, with the 4 tongues located in the same ratchet slot.

Main Board Connectors

CAUTION: The instrument is double insulated. All external circuits connected must provide double insulation. Failure to comply with the installation instructions may impact the protection provided by the unit.

CAUTION: Check correct operating voltage on the side label before connecting power. A UL listed anti-surge fuse should be fitted to the power input. An IEC60947-1 & IEC60947-3 compliant isolation switch should be fitted close to the unit, in easy reach of the operator, and appropriately marked.

NOTE: The wiring diagrams show all possible option combinations. The connections required depend on the options & modules fitted. Use single strand (1.2mm / AWG18 max size) copper wire, except for thermocouple inputs, where the correct thermocouple or compensating cable and connectors should be used.

2. POWER UP SEQUENCE

Following the power-up self-test and logo screen, the instrument normally enters Operation Mode from which the user can select the instrument's Main Menu (refer to the Screen Sequences on page 5). The exceptions to this are the first power-up after purchase where the Setup Wizard is shown, or if a plug-in module error is detected.

Plug-in Module Errors

If an invalid or unknown module is detected in one of the plug-in module slots the message "Fault Found, Press U, for details" followed by "Replace faulty module in Module Slot n, Press O," (where n identifies the problem slot). The Service Contact information is displayed next showing details of who to contact if a fault persists.

CAUTION: Do not continue using the product until the issue causing the error is resolved.

3. OPERATION MODE

This mode is entered at power on, or can be accessed from the Main Menu. The initial screens shown in operation mode vary depending on the options fitted and the configuration. Subsequent screens display and may allow the selection or adjustment* of Setpoints, setpoint ramps, enable/disable control, auto/manual operation, alarm status, profiler & recorder status and graphical trend views. Some screens will persist until the user navigates away, others will 'time-out' back to the main screen (refer to **Operation** Mode: in Screen Sequences).

Press \circlearrowright or \Diamond briefly to move forward/back through parameters. Where adjustment is possible*, press \bigtriangledown or \triangle to alter the values. The next/previous screen follows the last parameter - or hold down U or (1>1 sec to skip straight to next/previous screen acceptng ALL values shown.

* If required, all Operation Mode parameters can be made read only (see Display Configuration on page 6) and others may be removed from this mode altogether.

200.1 Loop No, & Time Markers Sample Interval (or Time (10 samples per marker) At Cursor Line) Trend View

The Trend Views graph PV; PV & SP; or Max/Min PV between samples, plus active alarms. Graph format and sample intervals are set in Display Configuration. Trend scale values adjust automatically to visible data (between 2 to 100% of input span). 120 of 240 historical data points visible. Pressing \bigtriangledown or \bigtriangleup moves the Cursor Line back through the last 240 data points.

Depending on the Control Configuration settings, automatic or manual control can be selected from the Auto/Manual selection screen, or via a digital input. Switching to or from manual mode is via Bumpless Transfer.

In Manual mode the Setpoint display is replaced by a -100 to 100% power output level, labelled "Man".

Press \bigtriangledown or \triangle to set the required manual power.

When using VMD control, Manual mode replaces the Setpoint display with the valve movement status (Opening, Closing or Stopped), and is labelled "Man". The \triangle key opens the value and the ∇ key closes the value.

If Manual control is selected when in Cascade mode, the slave loops % power value is shown. This is the power output fed directly to the control actuator (e.g. heaters).

NOTE: Selecting Manual Control will cause a running profile to hold until control is returned to automatic mode.

CAUTION: Manual mode overrides the automatic control loop. It also ignores any output power limits, valve open/close limits and the control enable/disable setting. The operator is responsible for maintaining the process within safe limits.

Over/Under Range & Input Fail Indicatio

If the process or auxiliary inputs are >5% above or below the scale max/min, the displayed value is replaced with the word "HIGH" or "LOW".

If a signal break is detected, the value is replaced with "OPEN"; except in Ratio control where an open input 1 or 2 is shown as "x1-Open" or "x2-Open".

An un-calibrated input is replaced by "ERROR".

In OPEN or ERROR conditions, the Control Outputs go to the pre-set power value (see Control Configuration on page 6).

CAUTION: Correct the problem causing the error condition before continuing normal operation.

Customizing Operator Mode

The user can choose to enable or disable some operator mode screens from the Display Configuration menu (see page 6). These are: cascade mode switching; auto/manual control selection; setpoint ramp-rate values; selecting the setpoint source; control enable/disable; clear latched outputs; manually triggering a recording; recorder status information and trend views – these are marked **I** in the screen list on page 5 to indicate that they are optional. In addition, up to 50 configuration mode parameters can be copied into operation mode using the PC software. Any parameters selected in this way are shown at the end of the mal operator mode screen sequence.

NOTE: Configuration mode parameters copied into operation mode are not pass code protected.

It is recommended that you only enable operator mode screens if they are important for daily operation. Consider using Supervisor Mode (see section 21) for parameters that the operator may need less often or that you want to limit access to.

4. AUTOMATIC TUNING

To automatically optimize the PID tuning (PI tuning in VMD mode) for the process, you can use Pre-Tune, Self-Tune or Auto Pre-Tune independently for each loop. Pre-tune performs a single start-up disturbance test. It stops running when the test has completed. The user chooses which PID set the new tuning terms will be applied to, and this selection does not change the selected "active PID set". There are two modes: Standard Pre-Tune which tests the process response half-way from the activation point (the process value when pre-tune began running) to the current setpoint; or Pre-Tune at Value which allows the user to specify the exact process value at which the test will occur.

CAUTION: Consider possible process over-shoot when selecting the value to tune at. If there is a risk of damage to the product or equipment select a safe value.

If Auto Pre-Tune is selected, a Standard Pre-tune will attempt to run at every power up. If Self-Tune is selected it constantly monitors the process and adjusts the tuning when control errors occur. Auto pre-tune and self-tune apply the new tuning terms to the current Active PID set. Auto pre-tune and self-tune are not possible with cascade.

NOTE: To pre-tune a cascade, first select "Cascade-Open" to tune the PID set(s) on the slave. After the slave has successfully tuned, remember to pre-tune the master/slave combination (this time select "Cascade-Closed"). The cascade remains open until you do this.

See PID Sets & Gain Scheduling on this page and Automatic Tuning on page 5. Refer to the Full Product Manual (from your supplier) for more about tuning.

NOTE: Automatic tuning will not engage if either proportional band is set to On/ Off control. Also, pre-tune (including and auto pre-tune attempt) will not engage if the setpoint is ramping or the Process Variable is <5% of span from setpoint. Also refer to Profile Notes.

5. PID SETS & GAIN SCHEDULING

Up to 5 sets of PID tuning terms (primary & secondary proportional bands or on-off differential, integral & derivative times, overlap/deadband) can be entered for each control loop, allowing the unit to be pre-set for differing conditions. For each loop one set can be selected as the "Active PID" set, or alternatively, if the process conditions change significantly during use (e.g. if it is partially exothermic as the temperature rises) Gain Scheduling can be employed.

Scale Upper Gain scheduling 'bumplessly' switches PID sets automatically at successively higher setpoint or process values, giving optimal control across a wide range of process conditions. PID set 1 is used from the scaled input lower limit until the "breakpoint" for set 2 is passed and that set becomes active. Set 2 is used until the breakpoint for Set 3 is reached etc. If any breakpoint

is set to OFF, the subsequent PID sets are not used.

See Automatic Tuning section 4 for tuning the PID sets

NOTE: ON/OFF control is possible with the individual PID sets but cannot be used with gain scheduling. On/off control is replaced with the default proportional band if gain scheduling is turned on.

6. APPLICATION SETUP

Setup Wizard

An easy **Setup Wizard** runs automatically at first ever power-up. Follow the wizard to setup parameters required for basic applications. The screens/parameters marked "w" in the Screen Sequences lists are included, see pages 5 & 6. The wizard can be run again at any time from the main menu. An option to reset all parameters to default (recommended) is offered when manually running the wizard

4081 & 4082 Process Controller Quick Start Manual PK531 (0037-75563) Page 2 of 6

Pre-Commissioning Considerations

The next sections provide guidance for more complex applications where the wizard is not sufficient. It is important to understand how the instrument is to be used before commencing with the setup. Consideration must be given to the following questions: If fitted, how will the 2nd input be used?

- One loop only (2nd input not used in this application)
- Two independent control loops.
- Valve feedback for loop 1
- A "redundant" backup for the 1st input (see section 10).
- Cascaded with the first control loop (see section 7).
- A reference input for ratio control (see section 8).
- How will the instrument control the process?
- Primary only or primary & secondary control outputs (see section 12).
- Direct valve motor drive outputs (see section 11).

The table below shows the main input and control configuration settings for these application types (see page 6 for the configuration menus).

Process Type* (only if 2nd input fitted)	Loop 1/Master Control Configuration: Control Select	Control Configuration: Control Type	Loop 2 / Slave Control Configuration: Control Select	Control Configuration: Control Type
One Loop* Input 2 Config. Input 2 Usage = Not Used	Standard PID Control Select = Control Std.	Primary Only Control Type = Single Primary/Secondary Control Type = Dual		
	Valve Motor Drive Control Select = VMD (TPSC) Ctrl.			
Two Loops* Input 2 Config. Input 2 Usage	Standard PID Control Select= Control Std.	<u>Primary Only</u> Control Type = Single Primary/Secondary Control Type = Dual	Standard PID Con- trol Select = Control Standard	Primary Only Control Type = Single Primary/Secondary Control Type = Dual
	Valve Motor Drive Control Select = VMD (TPSC) Ctrl.		Valve Motor Drive Control Select = VMD (TPSC) Control	
+Feedback* Input 2 Config. Input 2 Usage = Feedback	Valve Motor Drive Ctrl. Select = VMD (TPSC) Control			
Redundant* Input 2 Config. Input 2 Usage = Redundant Input	Standard PID Control Select = Control Std.	Primary Only Control Type = Single Primary/Secondary Control Type = Dual		
	Valve Motor Drive Ctrl. Select = VMD (TPSC) Ctrl.			
Cascade* Input 2 Config. Input 2 Usage = Standard AND Loop 1 / Master Config. I Control Mode = Cascade			Standard PID Control Select = Control Standard Valve Motor Drive Control Select = VMD (TPSC) Control	Primary Only Control Type = Single Primary/Secondary Control Type = Dual
Ratio* Input 2 Config. I Input 2 Usage = Standard AND Loop 1 / Master	Standard PID Control Select = Control Std. Valve Motor Drive Control Select			
Config. Control	= VMD (TPSC)			

Which outputs will be used for control, and are alarms or event outputs needed?

• Output configuration (see page 6).

• Alarms & Profile Events (see pages 5 & 6).

- Where will the controller setpoint come from?
- Local setpoint(s) only, or a remote setpoint input (see page 6).
- Profile Control (see section 15).
- Is Input re-configuration required:
- Analog input calibration & scaling (see section 13).
- Digital input functions (see section 9).
- Which other features are to be used?
- Data Recorder (see section 17).
- Serial Communications (see section 19).
- USB Interface (see section 16).

CAUTION: Configuration & commissioning must be completed before proceeding to Operation Mode. It is the responsibility of the installing engineer to ensure that the configuration is safe.

7. CASCADE CONTROL MODE

Applications with long time lags (e.g. with two or more capacities such as heated jackets) can be difficult to control with a single control loop. The solution is to split the process into two or more cascaded loops consisting of a Master and Slave(s) acting on a common actuator. Ideally, the slave loop's natural response time should be at least 5 times faster than the master

The master loop compares the process temperature with the desired setpoint and its correcting variable (0 to 100% PID output) becomes the slave loops effective setpoint

(scaled to suit the process). This setpoint is compared to the slave's process input, and the controlling actuator is adjusted accordingly.

NOTE: Cascade control is available on models fitted with the 2nd Universal Input. The master connects to input 1; the slave to input 2.

In this example the controlling actuator is a heater, indirectly heating the product via an oil jacket. The maximum input to the slave represents 300°C, thus restricting the jacket temperature. At start-up the master compares the product temperature (ambient) to its setpoint (250°C) and gives 100%. This sets the maximum slave setpoint (300°C), which is compared to the oil temperature (ambient) and the slave requests max. heater output.

As the oil temperature rises towards the slave setpoint, its output falls. Eventually, the product temperature will also begin rising, at a rate dependant on the transfer lag between the oil jacket and the product. This causes the master's PID output to decrease, reducing the slave setpoint. The oil temperature is reduced towards the new slave setpoint. This continues until the system becomes balanced. The result is quicker, smoother control with the ability to cope with changes in the load. Overshoot is minimized and the jacket temperature is kept within acceptable limits. Cascade Operation

Normal Cascade Operation

During operation, the master and slave are coupled together and. "Cascade" is displayed. The master process value and setpoint are most relevant to the user. This setpoint is directly adjustable, and the process value of the slave controller is displayed for information only

Cascade-Open

The cascade can be disconnected via the keypad. This switches from normal operation to direct control of the slave. "Cascade-Open" is displayed. The process is then controlled and adjusted solely by the slave controller using its internal setpoint (displayed as SlaveSP). Switching back to Cascade is "Bumpless".

Manual Mode

.

The controller can be put into manual mode (via digital inputs or menu selection), bypassing the cascade to take direct control of the slave loop's correcting variable. Manual power is adjusted from -100 to 100%. "MAN" is displayed in manual mode

CAUTION: Manual mode disables the cascade loop. It also ignores any output power limits, valve open/close limits and the control enable/disable setting. The operator is responsible for maintaining the process within safe limits.

The user can tune manually or use the pre-tune feature (see Automatic Tuning). In either case the slave control loop must first be optimized on its own, followed by the master loop in combination with the previously tuned slave.

- To pre-tune a cascade:
 - . Go to the Automatic Tuning menu
- 2. Select "Cascade-Open" to tune the PID set(s) on the slave.

3. After the slave has successfully tuned, pre-tune the master/slave combination (this time select "Cascade-Closed"). The cascade remains open until you do this. To manually tune a cascade:

- 1. Open the cascade, breaking the link from master to slave.
- Set the slave controller setpoint manually to an appropriate value.
- 3. Tune the slave for relatively fast control ('proportional only' is often sufficient).
- 4. Close the cascade and tune the master/slave combination.

8. RATIO CONTROL MODE

A ratio control loop is used where the quantity of one of the material is to be controlled in proportion to the measured quantity of a second material. The controller mixes the materials at the desired ratio by adjusting the flow of input 1. The flow of input 2 may be controlled separately, but is not controlled by this loop.

The process value used by the controller is therefore determined by the ratio of the two inputs rather than being measured as one process variable.

NOTE: Ratio control is available on models fitted with the 2nd Universal Input. Connect the Air flow to input 1 and the fuel to input 2.

Stoichiometric Combustion

Below is an example of standard ratio control using stoichiometric combustion. For optimum combustion the fuel-air ratio must be controlled. The ratio is selected so that there are no inflammable residues in the waste gas.

It is normal in this application to display the process value and setpoint as relative values rather than the physical ratio or absolute values. A scaling factor is set such that the displayed value will be 1.00 at the correct stoichiometric ratio for the application

Inputs 1 and 2 are configured and scaled to match the attached flow meters. In this example a 4 to 20 mA signal at x1 represents 0 to 1000m³/h of airflow controlled by a valve. The second 4 to 20 mA signal at x2 represents 0 to 100m3/h of fuel oil. The fuel flow is not affected by this control loop. Atomizing air is fed in with the fuel oil at a constant rate 'NO'. This must be considered when calculating the correct fuel/air mix. Total airflow is $x_1 + NO$. The stoichiometric factor. SFac is entered to match the desired ratio. E.g for 10 parts total airflow to one part fuel. SFac would be 10.

The setpoint (entered as a relative value such as 1.00) is multiplied by SFac when calculating the control deviation. E.g. with a setpoint of 1.00 and SFac of 10 the controller attempts to make the physical ratio 10. With a setpoint of 1.03 it would attempt to make the ratio 10.3 for 3% excess air.

The instantaneous (controlled) process value is calculated from the physical ratio, divided by SFac. Like the setpoint, this is displayed as relative value. E.g. if SFac is 10, 59.5m³/h air is measured at x1, 0.5m³/h atomizing air is applied at NO and 6m³/h fuel is measured at x2, the instantaneous process value would be

lanoouo	p100000	valuo	would bo.	
	<i>x</i> 1 +	NO	<u>59.5+0.5</u>	= 1

$$\frac{x1+N0}{x2*SFac} = \frac{39.3+0.3}{6*10} = 1.00$$

9. DIGITAL INPUTS

Digital inputs are driven to one of two states (active or inactive) by an applied voltage signal or a contact opening/closing. They can be used for profile selection (see Digital Input Setup sub-menu on page 6), with any remaining inputs available for functions such as selecting setpoint sources, running a profile or driving an output on/off (the Digital Input Specifications on page 4 lists all possible functions).

A diagnostic screen assists commissioning and fault finding by showing the current signal state for all digital inputs.

Slot A, C1 to C8 & Soft digital input status (𝜌 = Active, 𝒴 = Unavailable) Profile select bit format (BCD or Binary)

Profile selected (e.g. BCD 6 from C1-C3) Digital inputs can be inverted to reverse Digital Input Setup

Four "soft" digital inputs can be configured

by combining physical inputs, alarms &

⊘⊡⊡⊡⊡⊡⊡⊡

their action with an "on" input turning off. ick Inputs to Invert Step thorough each input using the U key. Press û to invert ☑ the highlighted input and \oplus to un-invert **D** Hold \bigcirc down to skip to next screen accepting the

mimicking key presses. **10. REDUNDANT INPUT**

values shown

If the 2nd universal input is fitted, it can be used with a backup sensor so that if the main sensor fails, the instrument automatically switches to the redundant sensor. In this condition, if input 1 has a signal break alarm configured it will activate, but any other process input or control status alarms seamlessly switch to the 2nd input. This input continues to be used until the signal to input 1 is restored. The user may not even be aware of the sensor fault, so signal break alarms should be configured for both inputs to provide notification.

The redundant sensor must be of the same type, and be correctly located in the application ready to take over if needed. If this option is selected, the 2nd input cannot be used for other functions

NOTE: If both signals are lost at the same time, the PV is replaced with "OPEN" and the normal sensor break actions occur.

11. VALVE MOTOR / 3-POINT STEPPING CONTROL

When directly controlling motorized modulating valves, set the Control Mode to VMD in configuration mode to enable the 3-point stepping Valve Motor Drive control algorithm. This provides switched outputs to move the valve further open, or further closed when a control deviation error is detected. If the error is reduced to zero no further output is required until the load conditions change.

NOTE: Some modulating valves have positioning circuitry to adjust the valve position. These need a DC linear mA or voltage output and use the standard control algorithm (Set Control Mode to Standard).

VMD doesn't allow On-Off Control (Prob. Band minimum is 0.5% of input span) and usually requires PI control, where the Derivative parameter is turned OFF.

Special Wiring Considerations for Valve Motor Control

Valve Motor Drive (VMD) mode requires two identical outputs to be assigned to position the valve. One to Open and one to Close the valve. These outputs can be two single relays, two triacs, two SSR drivers or one dual relay, but it is recommended to use two single relays (SPDT change-over contacts), and to interlock the wiring as shown. This prevents both motor windings from being driven at the same time. even under fault conditions.

CAUTION: The windings of a valve motor effectively form an autotransformer. This causes a voltage doubling effect when power is applied to either the Open or Close terminal, causing twice the supplied voltage at the other terminal.

Switching actuators directly connected to the valve motor must only be used up to half of their rated voltage. The internal relay and triac outputs are rated at 240 VAC Therefore, the maximum motor voltage when using them is therefore 120 V unless interposing relays are used. Interposing relays or other devices used to control the valve must themselves be rated for twice the motor supply voltage.

sition Feedbacl

The VMD mode in this instrument uses a boundless, open-loop, algorithm. It does not require any kind of position feedback in order to correctly control the process and can therefore avoid problems associated with faulty feedback signals

However, where feedback is available it can still be displayed as a percentage (0 to 100%) of the possible valve opening.

Valve Position Feedback is usually provided by means of a potentiometer mechanically linked to the valve. The output of a related flow meter can also be used to indicate the relative valve position. Flow meters typically have linear 0-20/4-20 mA or 0-5/0-10 V signals. To display the position/flow signal the 2nd input is must be configured for this purpose.

The input is adjusted and scaled to read 0 to 100% for valve fully closed to fully open or for the flow rate equating to fully closed and open.

Valve Limiting

When Valve Position Indication is to be used the signal can be used by the instrument to limit the valve movement. Valve limits can be set beyond which the controller will not attempt to drive the valve.

CAUTION: These limits must be used with care. They are effectively control power limits. Do not set values that prevent proper control of the process!

12. CONTROL TYPE

The control type defines if a control loop has single (unidirectional) or dual (bidirectional) control outputs. Single control has a primary output only. This can drive the process in one direction (e.g. heating only, cooling only, increasing humidity etc). Dual control has both primary and secondary outputs which can force the process to increase or decrease (e.g. heating & cooling, humidifying & dehumidifying etc). This selection isn't required for VMD control which provides direct 3-point stepping control for valves, and always has one output to increase and another to decrease the process value (see section 11).

13. INPUT CALIBRATION & SCALING

The process inputs can be adjusted to match the characteristics of the attached process or to remove sensor errors. For each loop, independent use of base (unadjusted), single point offset or two point calibration strategies are possible, as is the use of multi-point scaling for the displayed values.

CAUTION: Calibration & Scaling must be used with care. Careless use could lead to the displayed value bearing no meaningful relationship to the actual process variable. There is no front panel indication of when these parameters are in use.

ed by qualified personnel as it overwrites the factory calibration - refer to the Full Product Manual if this is required.

ngle Point Calibration

This is a 'zero offset' applied to the process variable across the entire span. Positive values are added to the reading, negative values are subtracted. It can be used if the error is constant across the range, or the user is only interested in a single critical value. Simply enter a value equal, but opposite to the observed error.

4081 & 4082 Process Controller Quick Start Manual PK531 (0037-75563) Page 3 of 6

Two Point Calibration

This method is used where an error is not constant across the range. Separate offsets are applied at two points in the range to eliminate both zero and span errors. Measure the error at a low point in the process, and again at a high point. In the Input Calibration, enter the desired low point as the Calibration Low PV value, and an equal, but opposite value to the observed error as the Calibration Low Offset. Repeat this for the high point PV and calibration offset in the next screen

NOTE: Choose values as near as possible to the bottom and top of your usable span to achieve maximum calibration accuracy. The effect of any error can grow past the chosen calibration points.

If an input is connected to a linear signal (mA, mV or VDC), multi-point scaling can be enabled for that input from the Input Configuration sub-menu, so that a non-linear signal can be linearized

The scaled input upper & lower limits define the values shown when the input is at minimum and maximum values. Up to 15 breakpoints can scale the input vs. displayed value between these limits.

Enter the 1st Scaling point (this is a % of the scaled input span), and the desired display value to be shown at that input value. Next set the 2nd point and display value, followed by the 3rd etc. Continue unit all breakpoints are used or you have reached 100% of the input span. A breakpoint set at 100% ends the sequence It is advisable to concentrate the break points in the area of the range with the most non-linearity, or an area of particular importance to the application.

14. SETPOINT SOURCES

The setpoint is the target value at which the instrument attempts to maintain the process variable. Each loop can have a Main "local" setpoint set from the keypad and Alternate setpoint. The alternate setpoint sources can be either another local Setpoint" or a remote setpoint (RSP), set by a mA or V DC signal fed to the auxiliary or 2nd process input. The controller can only use one setpoint source at a time for each loop. This is called the "Active Setpoint"

Main/alternate setpoint selection can be made via a digital input: from Control Configu ration or if enabled in Display Configuration, an operator menu can be used to select the setpoint

Refer to the control configuration screen on page 6 for setpoint settings.

NOTE: In profile control mode, the selected profile provides the active setpoint source for one or both control loops (see section 15). Once profile control mode is exited, the selected Main or Alternate setpoints become active again.

15. PROFILER OPTIONS

The Profiler (or setpoint programmer) feature allows the user to store up to 255 profile segments (each with the possibility of 2 setpoints in two-loop control), shared between a maximum of 64 Profiles. Each profile controls the value of the setpoint(s) over time; increasing, decreasing or holding their values as required.

NOTE: If this feature is fitted, Profiler options are added to the Main Menu, and optionally to Operation Mode. See sections 3 & 20.

Profiler Enal

Controllers supplied without the Profiler option can be upgraded in the field by purchasing a licence code. To obtain the correct code you must tell your supplier the instrument serial number - this can be found in Service & Product Information

To enter this code, hold down the $(1 + \sqrt{2})$ kevs during the power-up splash screen

Enter the 16-character licence code in the displayed screen, then press U.

To confirm if profiling is installed, refer to Service & Product Information.

General Profile Configuration

General profile configuration settings apply to all profiles. They enable/disable profile editing while running, and automatic starting of profiles that were setup with delay or day & time start triggers. When disabled profiles can only be manually started, and this is with immediate effect even if they have a delay or day & time trigger defined.

When enabled, delayed starts are possible, and if the selected profile has a day & time trigger it will wait and then start at the time set.

Profile Header & Segment Information

Each profile has its own header information plus 1 or more segments. The header contains the profiles name; if it is to control one, two loops or cascade; how it should start & stop; abort/power-loss recovery actions and if it should repeat. Segments can be ramps, dwells, steps or special segments such as holds, ends, joins or loop backs.

Following a Start Trigger, profiles can start immediately, or if enabled after a delay, or at a specified day & time (Recorder only).

NOTE: Profiles with segments outside of the current setpoint limits will not run. A "profile not valid" error shows.

Segments have an end of segment Target Setpoint. If the 1st segment is a Ramp-Time, the slope needed to reach the target changes with the Starting Setpoint value. For a Ramp-Rate segment, the time will change instead. A Dwell (or "soak") holds the last segments value. Step segments jump straight to the target value.

Segments in two-loop controllers control the setpoints of both loops

Two Loop Profiles

If required, the setpoint of both control loops can be maintained when profiling The example to the right shows how this works. Auto-Hold settings and target setpoints are independent for each loop, but the segment types and time settings are the same. Seg. ①& ② shows a ramp and a dwell with the shared time base.

The ramp direction can be different (Seg. (3), and although one loop can-

not ramp while the other dwells, a "dwell" is achieved by a ramp with its final setpoint value at the same value as the previous segment (Seg. G). Similarly, if only one loop is to Step to a new value, make the other "step" to its existing setpoint value. If you later change the previous setpoint, you may have to change both segments.

The Loop-back feature takes both loops back to the previous segment. Ramp-Rate segments are not possible with 2-loop profiling.

NOTE: Either loop can cause the profile to auto-hold. The profile continues only when both loops are back within their hold bands

Run/Hold Segments

A **Hold** condition during a segment maintains the current setpoint value of both loops. Once the hold is stopped the Ramp or Dwell continues.

NOTE: A running segment will hold if the operator or a digital input instructs it to, during "auto-hold", if one of the profile control loops is disabled, if a cascade is set to "open" or if manual control is selected.

A Hold Segment maintains the value of the last segment. The profile does not continue until a Continue Trigger occurs. This can be via a key press, a digital input signal or after waiting for a time of day (Recorder only).

Loops Segments

A Loop Segment goes back to a specified segment. This action is repeated for the required number of times (1 to 9999) before the profile continues onwards. More than one Loop Segment can be used, but they must not cross.

Profile Cycles & Repeat Sequences

A profile can be made to run itself 1 to 9999 times or continuously using the Profile Cycles setting. A profile ending with **Repeat Then End** will run the entire sequence of profiles again 1 to 9999 times or continuously.

Auto-Hold

16

Fach segment has independent Auto-Hold settings. If used, these ensure process and profile remain synchronized. If the process does not closely match the setpoint, the profile can be held until it returns within bounds. The segment time is increased by the time that the process is out of bounds. When Auto-Hold is active the profile status is shown as Held. The user can choose to hold the profile if the process beyond the Hold Band Above only, Below only or Band (either side of the setpoint). 2-loop profiling has individual Auto-Hold settings for the two loops. The entire profile (i.e both loops) will be held if either process is outside of its Auto-Hold Band.

Held if Auto-Hold set to Below Setpoint or Band

End, Abort and Power/Signal Lost Recovery

If the power is cut or the input is lost (either signal for 2-loop profiling) while a profile is running, the instrument will use the defined Profile Recovery Method once the signal power returns. These options are explained below.

- Restart the profile again from the beginning.
- Continue profile from the point it had reached when the power failed

On Recorder versions, option **E** will always be used if the power / signal is lost for less than the Profile Recovery Time. If the power / signal is lost for more than this time the defined Profile Recovery Method is used.

Similar options are offered for the Profile End Action taken at the normal profile end, or for the Profile Abort Action if the profile is force to end before it is finished. These can be defined to act in a similar manner as A. B or C above.

16. THE USB INTERFACE

The USB Interface can be used to upload or download instrument settings to or from a USB memory stick. It allows easy configuration of multiple instruments or the transfer of settings to/from the PC configuration software. If the Data Recorder or Profiler options are fitted, recordings and profile information can also be transferred via USB memory stick.

NOTE: If this feature is fitted, a USB Menu option is added to the Main Menu. See USB Port information in section 20.

USB Memory Stick Folders & Files

When a USB stick is inserted, the instrument looks for, and if necessary creates the DE-VICE, CONFIG, PROFILE and RECORDER folders. Files must be located in these folders in order to be used. When preparing to upload files from your PC, ensure that you save

The recorders RTC allows a "calibration due reminder" to be shown if the date is equal to or after the Calibration Reminder Date. The reminder screen persists until the O key is pressed. If due, the reminder is shown at Power-up, and repeated every 24hrs until the reminder date is changed

See Input Configuration: for the calibration reminder settings.

COMMUNICATIONS	
PC Configuration	
Functions	PC software configuration, data extraction and profile creation.
Connection:	RS232 via PC Configurator Cable to RJ11 socket under case.
Isolation:	Isolated from all inputs/output except SSR drivers. Not rec- ommended for use in live applications.
Functions	Setpoint broadcast master or general communications slave
Tunctions	(inc. extraction of data recordings, transfer of configuration & profile files to/from PC software).
Connection:	Plug-in Module Slot A. Connection to rear terminals 16-18.
Protocol:	Modbus RTU.
Address Range	Slave address 1-255 or Setpoint master broadcast mode.
Data Type:	10 or 11 (1 start & 1 stop bit 8 data bits plus 1 optional parity bit)
Isolation:	240V reinforced safety isolation from all inputs and outputs.
Ethernet	
Functions	General communications (inc. extraction of data recordings, transfer of configuration & profile files to/from PC software).
Connection:	Locates in Module Slot A. Connection via RJ45 connector on top of case.
Protocol:	Modbus TCP. Slave only.
Supported Speed:	10BaseT or 100BaseT (automatically detected).
ISOIATION:	240v reinforced safety isolation from all inputs and outputs
Functions	Extraction of data recordings, transfer of configuration & pro-
Connection:	files files to/from PC software or direct to another controller.
Protocol:	USB 1.1 or 2.0 compatible. Mass Storage Class.
Supply Current:	Up to 250mA.
Targeted Peripheral:	USB Memory Stick with FAT32 formatted file system.
Isolation:	Reinforced safety isolation from all inputs and outputs.
LOOP Control	
Control types	 or 2 control loops, each with either standard PID (single or dual control) or Valve Motor Drive (3-point stepping PID control). 2 internally linked cascade loops, with standard PID (single or dual control) or Valve Motor Drive (3-point stepping PID control). 4 Detion for each water and the standard PID (single or dual control) or Valve Motor Drive (3-point stepping PID control).
VMD Feedback	Second input can provide valve position feedback or flow in-
Tuning Types:	dication. Feedback not required or used for control algorithm. Pre-tune, Auto Pre-tune, Self-tune or manual tuning with up to
Gain Scheduling	5 PID sets stored internally. Automatically switches the 5 PID sets at user definable break-
Proportional Bands:	points relating to PV or SP value. Single (Primary) or Dual (Primary & Secondary - e.g. Heat &
Automatic Reset:	Cool) 1 to 9999 display units or On-Off control. Integral Time Constant, 1s to 99min 59s or OFF
Rate:	Derivative Time Constant, 1s to 99 min 59s or OFF
Manual Reset:	Bias 0 to 100% (-100% to +100% with Dual control).
Deadband/ Overlap:	Uverlap (+ve values) or Deadband (-ve values) between Prima- ry & Secondary Proportional Bands for Dual Control. Adjust- able In display units - limited to 20% of the combined primary & secondary proportional band width.
Differential:	ON-OFF switching differential 1 to 300 display units
Auto/Manual Control:	Selectable with "bumpless" transfer when switching between Automatic and Manual control.
Cycle Times:	Selectable from 0.5s to 512s.
ALARMS	Ramp rate selectable 1 to 9999 LSDs per nour or Off (infinite).
Alarm Types:	7 alarms can be assigned as Process High; Process Low; PV- SP Deviation; Band; Control Loop; Rate Of Signal Change per minute – all with adjustable minimum duration* before activa- tion and optional start-up inhibit function. Input Signal Break; % Recorder Memory Used, Control Power High, Control Power Low or Unused. *CAUTION: If the duration is less than this time, the alarm will not activate no matter what the signal value is.
Alarm Hysteresis:	Adjustable deadband from 1 LSD to full span (in display units) for Process, Band or Deviation Alarms.
Combination Alarm & Events Outputs:	Logically AND or OR any alarm or profile event (inc Profile running or ended) to switch an output. This can be when the condition is true, or the condition is not true.
DATA RECORDER	
Recording Memory:	1Mb non-volatile flash memory. Data retained when power is turned off.
Recording Interval: Recording Capacity:	1; 2; 5; 10; 15; 30 seconds or 1; 2; 5; 10; 15; 30 minutes. Dependent on sample rate and number of values recorded. Example: Two values will record for 21 days at 30s intervals. More values or faster sample rates reduce the duration.
RTC Battery Type:	VARTA CR 1616 3V Lithium. Clock runs for >1 year without power.
RTC accuracy	Real Time Clock error <1second per day.

PROFILER	
A Profiler Enable Key ca	n be purchased from your supplier if the feature is disabled.
Profile Capacity	Max 255 segments, shared by max 64 profiles
Segment Types	Ramp Up/Down over time, Ramp Rate Up/Down*, Step, Dwell, Hold, Loop, Join A Profile, End or Repeat Sequence Then End. *Ramp Rate Up/Down is not available when profile controls two loops
Timebase	hh:mm:ss (Hours, Minutes & Seconds).
Segment Time	Maximum segment time 99:59:59 hh:mm:ss. Use loop-back for longer segments (e.g. 24:00:00 x 100 loops = 100 days).
Ramp Rate	0.001 to 9999.9 display units per hour.
Hold Segment Release	Release With Key Press, At Time Of Day or Digital Input.
Profile Starting Point	The first segment setpoint(s) begin from either the setpoint, or current measured input value, of the controlled loop(s)
Delayed Start	After 0 to 99:59 (hh:mm) delay, or at specified day(s) & time.
End On	Keep Last Profile Setpoint, Use Controller Setpoint or Control Outputs Off.
Abort Action	Keep Last Profile Setpoint, Use Controller Setpoint or Control Outputs Off.
Power/signal Loss Recovery	Continue Profile, Restart Profile, Keep Last Profile Setpoint, Use Controller Setpoint or Control Outputs Off.
Auto-Hold	Hold if input >Band above and/or below SP for each segment.
Profile Control	Run, Manual Hold/Release, Abort or jump to next segment.
Profile Timing Accuracy	0.02% Basic Profile Timing Accuracy. ±<0.5 second per Loop, End or Join segment.
Profile Cycling	1 to 9999 or Infinite repeats per profile.
Sequence Repeats	1 to 9999 or Infinite repeats of joined profile sequence.
Loop Back	1 to 9999 loops back to specified segment.
Segment Events	Events turn on for the duration of the segment. For End Seg- ments, the event state persists until another profile starts, the user exits from profiler mode, or the unit is powered down.
OPERATING CONDITION	DNS (FOR INDOOR USE)
Temperature:	0°C to 55°C (Operating), -20°C to 80°C (Storage).
Relative Humidity:	20% to 90% non-condensing.
Altitude	<2000m above sea level.
Supply Voltage and Power:	Mains versions: 100 to 240VAC ±10%, 50/60Hz, 24VA. Low voltage versions: 20 to 48VAC 50/60Hz 15VA or 22 to 65VDC 12W.
Front Panel Cleaning	Wash with warm soapy water and dry immediately. Close the USB cover (if fitted) before cleaning.
CONFORMANCE NOR	MS
EMI:	Complies with EN61326-1:2013. CE
Safety Considerations:	Complies with UL61010-1 edition 3, CE, UL, cUL. Pollution Degree 2. Installation Category II.
Front Panel Sealing:	To IP66 (IP65 front USB connector). IP20 behind the panel. (IP rating not recognized / approved by UL).
DISPLAY	
Display Type:	160 x 80 pixel, monochrome graphic LCD with a two color (red/green) backlight.
Display Area:	66.54mm (W) x 37.42mm (H).
Display Characters:	0 to 9, a to z, A to Z, plus () @ öß - and
Trend Views:	One optional trend graph for each control loop each with 120
	of 240 data points shown in a scrollable window. Data is not retained when power turned off or if time base is changed.
Trend Data:	Any active alarm, plus PV (solid) & SP (dotted) at sample time or Max/Min PV between samples (candle-stick graph). Auto scales from 2 to 100% of Input Span.
Trend Sample Rate:	1; 2; 5; 10; 15; 30 seconds or 1; 2; 5; 10; 15; 30 minutes. Set independently for each trend graph.
DIMENSIONS	
Weight:	0.65 kg maximum.
Size:	96 x 96 mm (Front Bezel). 117 mm (Depth Behind Panel).
Mounting Panel:	Panel must be rigid. Maximum thickness 6.0mm (0.25 inch).
Panel Cut-out Size:	92 mm x 92 mm. Tolerance +0.5, -0.0mm.
Ventilation	20 mm gap required above, below and behind.

18

Refer to Communications Configuration on page 6 for general communications settings, and Configuration via Software in section 22 if you need to set the Ethernet options IP address.

NOTE: The Full Product Manual (from your supplier) has detailed communi-cations protocol and parameter addressing information.

4081 & 4082 Process Controller Quick Start Manual PK531 (0037-75563) Page 5 of 6 **20. SCREEN SEQUENCES** Menus & screens displayed depend on how the instrument is configured. Most screens revert to Operation Mode after 2 minutes without key activity, those marked (3) below persist. Menus marked 🛔 = Require un-lock codes for access. Screens marked W are repeated in the Setup Wizard. Screens marked 🗖 are only shown if enabled in Display Configuration. Screen Navigatio Operation Mode: - Screens marked • are only shown if they are enabled in Display Configuration. Calibration Check Due Warning (5) If Calibration Reminder is set in Input Configuration, and the due date has passed. - Recorder version only. Press 🗸 + 🏠 to postpone calibration. LED Labels: () LED indicator functions. Defaults are PRI, SEC, TUNE & ALARM - LED functions and their labels can be altered with the configuration software. Process Value & Setpoint (or MAN): Process values and effective Setpoint (%Manual Power in Manual Mode or Valve Open / Stop / Close for VMD Manual Mode Control Deviation graph (±5% span) and Power graph (0-100% primary, ±100% primary & secondary or Valve OPEN/STOP/CLOSE in VMD mode). If VMD Control with input 2 used for position feedback, the power bar-graph shows 0 to 100% valve position. Bar Graphs: ③ LED indicator functions. Defaults are PRI, SEC, TUNE & ALARM – LED functions and their labels can be altered with the configuration software. LED Labels: Process Value & Setpoints (or MAN): Process values and effective Setpoint values for both loops (%Manual Power in Manual Mode or Valve Open / Stop / Close for VMD Manual Mode). Bar Graphs: Control Deviation graphs (±5% span) and Power graphs (0-100% primary, ±100% primary & secondary or Valve OPEN / STOP / CLOSE in VMD mode). LED Labels: (5) LED indicator functions Defaults are PRI, SEC, TUNE & ALARM - these labels can be altered with configuration software. Cascade Status, Master & Slave Cascade Status. Cascade = Cascade operating; Cascade Open = master / slave loops not linked. Master & Slave Process Values. Master Setpoint value (Slave Setpoint if Cascade Open, or Manual Power level in Manual Mode). Process Values & Setpoint (or MAN): ပ္ပဂ္ဂ Control Deviation graph (±5% span) and Power graph (0-100% primary, ±100% primary & secondary or Valve OPEN / STOP / CLOSE in VMD mode). Bar Graphs: LED Labels: (§ LED indicator functions. Defaults are PRI, SEC, TUNE & ALARM - these labels can be altered with configuration software. Ratio: Relative Ratio value and relative Setpoint value. Con Ratio Setpoint (or MAN): Ratio Setpoint value (or Manual Power level when in Manual Mode). Bar Graph: Control Deviation graph (±5% span) and Power graph (0-100%). If a profile is running, from: Do Nothing; Abort Profile (end immediately); Jump to Next Profile Segment; Hold Profile or Release Hold If profile not running, from: Do Nothing; Run Profile; Select Profile; End Profile Control; (return to std. controller operation). U LED indicator functions. Defaults are PRI, SEC, TUNE & ALARM - these labels can be altered with configuration software. Profile Control LED Labels: Process Value & Setpoints (or MAN): Process values and effective Setpoint values (%Manual Power in Manual Mode or value Open / Stop / Close for VMD Manual Mode) Bar Graphs: Profile name & progress bar graph with Running/Held/Stopped indicator. Current profile segment progress bar graph, with segment number and type. Event Status Active / inactive status of all configured Events - Profiler mode only. Cascade Mode Cascade-Open breaks the master-slave link when commissioning & tuning. Slave SP is adjustable directly. Caution: Return to Cascade when finished! Auto/Manual Control Selection Switches the loop shown between automatic and manual control - setpoint replaced by manual power level in manual mode. These screens possible for each control loop ir View and adjust local (internal) setpoints for the loop. The "active" SP is marked. - Remote setpoints are read only. Setpoint Value Display & Adjustment turn - if configured for Setpoint Ramp Rate Setpoint Ramp Rate adjustment for the loop shown (in display units per hour). 2-loop or cascade Select Active Setpoint Selects if the main or alternate setpoint is active for the loop shown. Control Enable Enables/disables the control loop outputs for the loop shown - setpoint is replaced by "OFF" when disabled. Alarm Status Lists any active alarms. The titles "Alarm n" can be replaced with the PC configuration software to a user defined 8 character name for each alarm. Clear Latched Outputs Hold down $\sqrt[7]{}$ for 3 seconds to clear selected latched output – Output only resets if the condition that caused it to latch on is no-longer present. Recorder Memory Full Warning Warns if the recorder memory is used up and that recording has either stopped or is overwriting older data if in FIFO recording mode. Set the manual recording trigger on or off. Even if set to off, recording will still take place if another recording trigger is active Manual Recorder Trigger Recorder Status Information Status (Recording or Stopped); active trigger icons; recording mode & time remaining and a %memory bar-graph - see the Data Recorder, section 17. A trend graph of PV & SP, or the Max/Min value of the PV between samples. Any active alarm(s) are indicated at the top of the graph. Trend View (Loop 1) Trend View (Loop 2) A trend graph of PV & SP, or the Max/Min value of the PV between samples. Any active alarm(s) are indicated at the top of the graph. Up to 50 Configuration parameters can be copied into Operation Mode using the PC software. In this mode they are not pass code protected. Note: Operation Mode screens can be made globally read only from Display Configuration - Custom Display screens ... Setup Wizard: Setup Wizard Unlocking **W** Enter correct code number to access Setup Wizard. Default Value = 10 Reset Defaults or Continue W Decide whether start wizard with current settings or default values (recommended). CAUTION: Resetting defaults all parameters, not just those covered by the quick setup wizard. For more complex applications the user may have to reconfigure other Configuration Mode settings before using the - Screens marked w W Press O to select each major configuration parameter in turn. Follow the on-screen prompts to alter the values. Setup Wizard Completed W Confirms completion of the Setup Wizard, Exits to Operation Mode. Supervisor Mode: If Supervisor Mode is configured (requires PC software to configure screens sequence), enter correct code number to configuration Menu entry for details. Press U to select up to 50 Configuration parameters in turn. Follow on-screen prompts to alter values. – see their Configuration Menu entry for details. Refer to the Configuration Menu Sequences on the following page for Supervisor Mode Unlocking - Supervisor Mode Screens Refer to the Configuration Menu sequences on the following page for information about the Configuration Sub-Menus Configuration Menu Configuration Mode Unlocking Enter correct code number to access Configuration Mode. Default Value = 10 Configuration Options Select required Configuration Menu Option from list. Press Uto continue. USB Menu USB Mode Unlocking Enter correct code number to access USB Menu. Default Value = 10 From: Read/Write Configuration File; Write Recorder Log File or Read/Write Profile File. Read/Write To USB Device Select Profile To Write If writing a profile to the USB Memory Stick, choose a profile to write from the list provided. Enter A File or Folder Name Enter an 8-character folder name for logs, or a file name for configurations and profiles. An extension (bct for configurations, .pfl for profiles) is addeed automatically Caution: Existing files/folders with the same name will be over-written. Writing Profile/Configuration/Log Recorder log, profile or configuration being written to USB. Caution: Do not disconnect USB device until completed! Data loss or corruption may result Transfer Successful Confirmation of successful data transfer. Press U to continue Select File Select Configuration or Profile file to transfer from the USB stick. Caution: A configuration read overwrites all existing instrument settings. Reading Profile/Configuration Profile or configuration is being read. Caution: Do not remove the memory stick whist this operation is in progress. Data loss or corruption may resul Transfer Successful Confirmation of successful data transfer. Press U to continue Transfer Failure For write failures, check the disk space on the USB stick. For read failures, check the maximum number of profiles/segments is not being exceeded Becorder Control Recorder Mode Unlocking Enter correct code number to access Data Recorder Menu – Default Value = 10. Manual Recorder Trigger Turn on or off the manual recording trigger. Note: Recording continues if another trigger active (e.g. on alarm/profile; manual start or digital input). Recorder Status Information Status (Recording or Stopped); active trigger icons; recording mode & time remaining and a %memory bar-graph - see the Data Recorder in section 17. Clear Recordings? Clears the recorder memory. Caution: Permanently removes All recorded data. - Only shown if recording is stopped> Profile Setup Profile Setup Menu Unlocking Enter correct code number to access the Profile Setup Menu, Default Value = 10 General Profile Configuration: Sub-menu with global settings affecting all profiles. Press $\sqrt[n]{2} + \sqrt[n]{2}$ to return to Profile Setup Menu Enable Edit While Running Enables/disables the ability to edit profiles whist a profile is running. Note: current or next segment will not change until after profile is restarted. Timer Start Function If enabled, delayed timer starts are possible, and if the selected profile has a day & time trigger waits until the time set, then starts automatically.

If disabled, profiles can only be manually started, and with immediate effect (delays or timer starts ignored).

21 SUPERVISOR MODE	
The purpose of this function is to allow selecte	d operators access to a lock-code protected
sub-set of the configuration parameters, with figuration menu unlock code. The PC softwar configuration menus for inclusion in the supe	but providing them with the higher level con- e is used to copy up to 50 parameters from rvisor mode screen sequence. If the param-

eter is normally displayed on screen with another parameter, both parameters will appear

NOTE: Supervisor mode is only available if one or more screens have been configured from the PC software. It is not possible to configure supervisor mode screens without using the software.

4081 & 4082 Process Controller Quick Start Manual PK531 (0037-75563) Page 6 of 6

Immune 4 Contram	Sub-menu to setup 1st input Press $\nabla + 0$ to return to Input Configuration Menu
input i Setup	ous mont to boup for input from V V o to fortain to input configuration mont
Input Type	w From Thermocouple, RTD and Linear inputs (mA, mV & VDC or Potentiometer) see the specifications (page 4) for details. Note: Always re-check units &
Engineering Units	w Select display units from: °C; °F; K; bar; %; %RH; pH; psi or none. Temperature sensor inputs are limited to °C; °F idecimal position after changing
Decimal Point Position	w Display resolution with 0: 1: 2 or 3 decimal places. Temperature sensor inputs are limited to 0 or 1 decimal place.
	 Display reconsidering in the second product comportant on the second or in a contract product of the second of the
Scaled Input Lower Limit	Sets the Usable span (min = 100 display units, max = range limits - see specs) for temperature inputs, the Upper & Lower Limits defin
	values shown (non - 555 to 555.5) when input is at minimum and maximum values, with Span – too display drifts.
Enable Multi-Point Scaling	Enables/disables Linear Input Multi-Point Scaling – not possible with temperature sensor inputs
Scaling Point n	If Multi-Point Scaling is enabled, up to 15 breakpoints* link % input values with the value to be displayed at that input. Adjustable between the linear
Display Value n	scale limits. *A Scaling Point set to 100% input ends the sequence.
Cold Junction Compensation	Enables/disables the internal Thermocouple Cold Junction Compensation. The default value is Enabled. – Thermocouple inputs only.
Input Filter Time	Filters unwanted noise from input signal, Adjustable from 0.1 to 100.0 seconds or OFF (default = 2s), Caution: Use with care!
Input 1 Calibration	Sub-monu to calibrate 1st input Bross Tr + 1) to return to Input Configuration Monu
	$C_{\rm exp}$
Calibration Type	Base (normal) Calibration; Single or 2 point Calibration. Use single or two point calibration to adjust readings. Caution: Use with care!
Calibration Offset	The single point calibration offset. Limited by input span, +Ve values add to, -Ve values subtract from measured input. Default = "OFF".
Calibration Low Value	The controller displayed value at which the low end calibration is being performed. Choose a value close to the bottom of application range.
Calibration Low Offset	Set low offset at known calibrated input minus the displayed value (e.g. for low cal displayed as 10, if known actual $=10.4$. Low offset would be $+0.4$)
Calibration High Value	The portroller displayed value at which high and exilipation is being performed. Charge a value along to the tap of application range
	The controller displayed value at which high end calibrations being periormed. Choose a value close to the top of application range.
Calibration High Onset	Set nigh onset at known cambrated input minus the displayed value (e.g. for nigh cardisplayed as 500, it known actual =497 Low onset would be -5).
Input 2 Setup	Sub-menu to calibrate 2nd input – if fitted. Press V + O to return to input Configuration Menu
Input Usage	w Standard (tollowing options as for input 1), Not Used, Redundant or Feedback. Redundant or Feedback disables use as 2nd control loop.
- Std use: Input 2 type, units, scaling e	etc. options as for input 1. Redundant: Input 1 settings duplicated. Feedback: mA, mV, VDC or Potentiometer only and used for valve or flow indication only.
	Press $\nabla + \Delta$ to begin feedback limit adjustment for the minimum valve travel - if Input 2 is Feedback
Set Valve Lower Position	Move valve to minimum travel (e.g. fully closed) using ∇ to close or Δ to open Pressing $\nabla + \Delta$ together stores feedback value at minimum travel
*	Proces $\overline{Q} + \Delta$ to hard head head limit adjustment for the maximum value travel - if limit 2 is Feedback
Set Valve Upper Position	Here $v \neq 0$ to begin resolution in a difference of the maximum valve rave $-n$ input 2 is resolution.
2 Invest 0 Oct it wet in a	widve varie to maximum travelies, unit open) using v to close of the open. The solid varies to be the open widve to maximum travel.
Input 2 Calibration	Sub-menu to calibrate 2nd input – if fitted (procedure as shown for input 1 Calibration). Press $\lor + \circ$ to return to input Configuration Menu
E Calibration Reminder	Sub-menu to setup a calibration reminder – if recorder is fitted. Press 🖓 + Ն to return to Input Configuration Menu
2 Calibration Reminder Enable/Disable	Enables/disables a Calibration Reminder shown at start-up (and daily thereafter), if the due date has passed.
Calibration Reminder Date	Sets the due date for Calibration Reminder - Recorder version only.
S Auxiliary Input A Setup	Sub-menu to setup auxiliary A input - if fitted. Press $\ddot{\nabla} + \dot{\nabla}$ to return to Input Configuration Menu
	From 0-20 or 4-20 m2 0-5 1-5 0-10 or 2-10 VDC linear
	From 22 of the min, boy ind, or to or 2-10 VDC Links. Soles the values used (Asturea, al. 0.01.2, 10.002) where availant instit A is at minimum and any institute for a smarth and the T
Aux A Input Lower Limit	value becomes the effective setpoint (constrained within extroint limit). Caution: Take area to scale correctly especially if used by both loss
Aux A Input Upper Limit	tale second in one of the one of
Auxiliary Input A Offset	Offset for Auxiliary Input A, from +/-0.001 to 20000 units or OFF. +Ve values add to, -Ve values subtract from measured input. Default = OFF.
Digital Input Setup	Sub-menu to setup the diaital inputs – if fitted. Press $\sqrt[n]{2}$ + \bigcirc to return to Input Configuration Menu

22. SOFTWARE SETTINGS

A communications settings screen is shown whenever the user attempts to connect to the instrument from the PC configuration software. If the settings are not as shown below, the PC configuration software cannot communicate with the instrument.

Connection from PC to Bottom Configuration Socket

Device connector = Configuration Socket. PC connector = the PC Serial Com port that you are connected to. Start and Stop bits = 1. Data bits = 8.

i NOTE: When uploading or downloading via the bottom mounted configura-tion port, the required software communication settings depend on the

module fitted in slot A. See the table below.

Slot A Module	Bit Rate	Parity	Address
Slot A Empty	19200	None	1
Digital Input	19200	None	1
Ethernet Comms	9600	None	1
Auxiliary Input	4800	None	1
RS485	Comms Must match the Communication Configuration menu settings.		

values are added and -ve values subtracted. Use when unit is a multi-zone slave to change the effective set- nt. Caution: It should be set to zero if an offset is not required if RS485 comms fitted.
